## NC STATE UNIVERSIT

# Programming in R Part I

Justin Post August 9, 2017

#### **Course Schedule**

#### Day's agenda:

- · 10-11:10 Session
- · 10-minute break
- · 11:20-12:30 Session
- · 12:30-1:45 Lunch
- · 1:45-2:55 Session
- · 10-minute break
- · 3:05-4:15 Session

# What do we want to be able to do?

- · Restructure Data/Clean Data
- Streamline repeated sections of code
- Improve efficiency of code
- · Write custom functions to simplify code

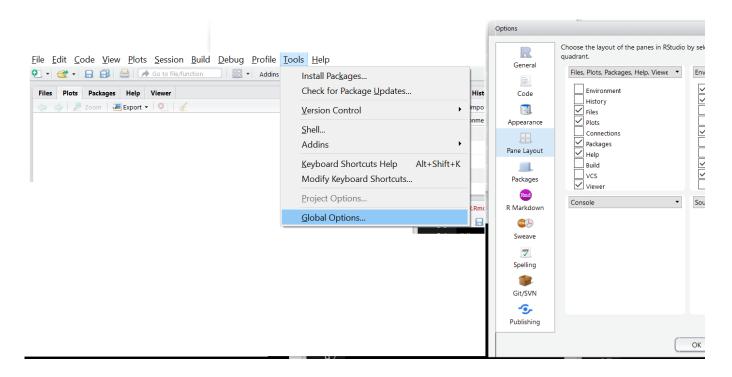

#### Where do we start?

- Review of concepts
- Using dplyr/tidry to manipulate data
- For loops
- · If/Then logic
- · Vectorized Functions
- Function Writing
- Parallel Computing

#### R Studio

- Great integrated development environment (IDE)
- · Four main 'areas' we'll use
  - Scripting and Viewing Area
  - Workspace/History
  - Plots/Help
  - Console

#### R Studio - Can rearrange panes

 Global options -> Appearance allows font/background changes

#### **Data Frames**

- Best R object for data sets
- · Collection (list) of vectors of the same length

```
x <- c("a", "b", "c", "d", "e", "f")
y \leftarrow c(1, 3, 4, -1, 5, 6)
z <- 10:15
data.frame(char = x, data1 = y, data2 = z)
    char data1 data2
##
## 1
             1
       a
                 10
                 11
## 2
       b
             3
## 3
      С
           4
                 12
      d -1
                13
## 4
           5
                14
      е
## 6 f
          6
                 15
```

#### **Data Frames**

· Consider the built in iris data set

iris

## 2	##		Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species

```

**Packages** - Many ways to accomplish the same thing in R

- How to choose?
  - Want 'fast' code
  - Want 'easy' syntax
  - Good default settings on functions
- Base R has reasonable defaults and syntax but functions are slow
- "<u>TidyVerse</u>" collection of R packages that share common philosophies and are designed to work together!
  - Very efficient code
  - Common syntax

· If not installed (downloaded) on computer

install.packages("tidyverse")

Once installed, library() or require() to load

library(tidyverse)

```
## Loading tidyverse: ggplot2
## Loading tidyverse: tibble
## Loading tidyverse: readr
## Loading tidyverse: purrr
## Loading tidyverse: dplyr

## Conflicts with tidy packages ------
## filter(): dplyr, stats
## lag(): dplyr, stats
```

#### **Tidyverse Syntax**

- Reason to prefer dplyr and packages from the tidyverse
- Fast!
- Good defaults
- All packages have similar syntax! All work on tibbles (data frames)
- Syntax: function(data.frame, actions, ...)

tbl\_df() - convert data frame to one with better
printing

- If data read in with haven, readxl, or readr already in this format!
- · Just 'wrap' data frame

```
#install.packages("Lahman")
library(Lahman)
head(Batting, n = 4) #look at just first 4 observations
```

tbl\_df() - convert data frame to one with better
printing

head(Batting, n = 4) #look at just first 4 observations

```

## #
```

- Applying multiple functions: nesting hard to parse!
- Piping or Chaining with %>% operator helps

```
Batting %>% filter(teamID == "PIT") %>% arrange(desc(G))
```

```

## #
```

- Applying multiple functions: nesting hard to parse!
- Piping or Chaining with %>% operator helps
- If dplyr or magrittr package loaded, can use anywhere

```
a<-runif(n = 10)
a

## [1] 0.08621019 0.80290471 0.14787124 0.18874695 0.99241232 0.486
## [7] 0.86030274 0.11337676 0.16658874 0.01879956
```

#### select() - subset columns

- Often only want select variables (saw \$ and [ ,])
- select() function has same syntax as other dplyr functions!

```
Batting %>% select(X2B)

## # A tibble: 101,332 × 1

## X2B

## <int>
## 1 0

## 2 6

## 3 4

## 4 10

## 5 11

## # ... with 1.013e+05 more rows
```

#Choose a single column by name

#### select() - subset columns

#all columns between

```
Batting %>% select(X2B:HR)

## # A tibble: 101,332 × 3

## X2B X3B HR

## <int> <int> <int>
## 1 0 0 0

## 2 6 0 0

## 2 6 0 0

## 3 4 5 0

## 4 10 2 2

## 5 11 3 0

## # ... with 1.013e+05 more rows
```

#### select() - subset columns

#### select() - subset columns

```
#all columns starting with
Batting %>% select(starts_with("X"))

## # A tibble: 101,332 × 2

## X2B X3B

## <int> <int>
## 1 0 0

## 2 6 0

## 3 4 5

## 4 10 2

## 5 11 3

## # ... with 1.013e+05 more rows
```

#### select() - subset columns

```
#all columns ending with
Batting %>% select(ends with("ID"))
## # A tibble: 101,332 × 4
     playerID yearID teamID
                           lgID

## 3
      red
               3
                                 ## 3 pink
                                                 L
```

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

 Only include observations found in both "a" and "b" (automatically joins on variables that appear in both tables)

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

include observations found in either "a" or "b"

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

include all observations found in "a"

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

include all observations found in "b"

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

right\_join(a, b) is identical to left\_join(b, a) except for column ordering

```
left_join(b, a)

## Joining, by = "color"

## # A tibble: 3 × 3

## color size num

## <chr> <chr> <int>
## 1 green S 1

## 2 yellow M 2

## 3 pink L NA
```

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

 filter "a" to only show observations that match "b"

```
semi_join(a, b)

## Joining, by = "color"

## # A tibble: 2 × 2

## color num

## <chr> <int>
## 1 green    1
## 2 yellow    2
```

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

 filter "a" to only show observations that don't match "b"

```
anti_join(a, b)

## Joining, by = "color"

## # A tibble: 1 × 2

## color num

## <chr> <int>
## 1 red 3
```

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

 sometimes matching variables don't have identical names

```
b <- b %>% rename(col = colo
                                    b
а
                                    ## # A tibble: 3 × 2
## # A tibble: 3 × 2

      color
                                          <chr> <chr>
##
              num
                                    ##
      <chr> <int>
                                    ## 1
##
                                          green
                                    ## 2 yellow
## 1 green
                                                     Μ
                 1
## 2 yellow
                 2
                                           pink
                                    ## 3
                                                     L
## 3
                 3
        red
```

```
left_join(), right_join(), inner_join(),
full_join() - combine multiple DFs
```

 specify that the join should occur by matching "color" in "a" with "col" in "b"

#### Overview of dplyr package cheatsheet

- Basic commands
  - tbl\_df() convert data frame to one with better printing
  - filter() subset rows
  - arrange() reorder rows
  - select() subset columns
  - mutate() add newly created column
  - transmute() create new variable
  - group\_by() group rows by a variable
  - summarise() apply basic function to data
  - left\_join(), right\_join(), inner\_join(), full\_join() - commands to combine multiple dfs

#### tidyr package

Easily allows for two very important actions

- gather() takes multiple columns, and gathers them into key-value pairs
  - Make wide data longer
  - Most important as analysis methods often prefer this form
- spread() takes two columns (key & value) and spreads in to multiple columns
  - Make "long" data wider

#### tidyr package

Data in 'Wide' form

```
tempsData <- read delim(file = "https://raw.githubusercontent.com/jb</pre>
                       master/datasets/cityTemps.txt", delim = " ")
tempsData

## Recap!

- Tidyverse useful
- · dplyr to manipulate data
- tidyr to expand, condense data

## **Activity**

- Manipulating Data Activity instructions available on web
- Work in small groups
- Ask questions! TAs and I will float about the room
- Feel free to ask questions about anything you didn't understand as well!

# What do we want to be able to do?

- · Restructure Data/Clean Data
- Streamline repeated sections of code
- Improve efficiency of code
- · Write custom functions to simplify code

- · Idea:
  - Run code repeatedly
  - Often change something as well
- Syntax

```
for(index in values){
  code to be run
}
```

· index defines 'counter' or variable that varies

```
for (i in 1:10){
   print(i)
}

## [1] 1
## [1] 2
## [1] 3
## [1] 4
## [1] 5
## [1] 6
## [1] 7
## [1] 8
## [1] 9
## [1] 10
```

· 'values' define which values index takes on

```
for (i in 1:10){
   print(i)
}

## [1] 1
## [1] 2
## [1] 3
## [1] 4
## [1] 5
## [1] 6
## [1] 7
## [1] 8
## [1] 9
## [1] 10
```

· 'values' define which values index takes on

```
for (value in c("cat","hat","worm")){
  print(value)
}

## [1] "cat"
## [1] "hat"
## [1] "worm"
```

- Code in loop can change based on index
- · Create small data set

```
set.seed(10)
data<-round(runif(5),2)
data
## [1] 0.51 0.31 0.43 0.69 0.09</pre>
```

Code in loop can change based on index

```
words<-c("first", "second", "third", "fourth", "fifth")</pre>
```

Loop through and print out the phrase

"The (#ed) data point is (# from data vector)."

```
paste0("The ", words[1], " data point is ", data[1], ".")
```

## [1] "The first data point is 0.51."

Code in loop can change based on index

- Example: Find summary() for each column of a data set
- Could loop through numeric columns
- Find summary() for each
- Consider smaller batting data set

```
Batting2010 <- Batting %>% filter(yearID == 2010) %>%
select(playerID, teamID, G, AB, R, H, X2B, X3B, HR)
```

 Want to find summary() for each column of a data set

summary(Batting2010[ , 3])

```
## G
## Min. : 1.00
## 1st Qu.: 15.00
## Median : 33.00
## Mean : 50.83
## 3rd Qu.: 74.00
## Max. :162.00
```

Loop through numeric columns

```
stats <- matrix(nrow = 6, ncol = 7)</pre>
for (i in 1:(dim(Batting2010)[2] - 2)){
  stats[ , i]<-summary(Batting2010[ , i + 2])</pre>
}
stats

### **Vectorized Function**

- Much better way to do this type of thing
- · Loops are slow, didn't keep attributes here
- · Covered later today!

## Recap!

- For loops reduce redundant code
- Syntax

```
for (index in values){
  code to execute
}
```

- Values can be a sequence of numbers or character values
- · Not ideal in R

## **Activity**

- For Loops Activity instructions available on web
- Work in small groups
- Ask questions! TAs and I will float about the room
- Feel free to ask questions about anything you didn't understand as well!
